## LETTERS

### Further evidence for small-bodied hominins from the Late Pleistocene of Flores, Indonesia

M. J. Morwood<sup>1</sup>\*, P. Brown<sup>2</sup>, Jatmiko<sup>2</sup>, T. Sutikna<sup>3</sup>, E. Wahyu Saptomo<sup>4</sup>, K. E. Westaway<sup>5</sup>, Rokus Awe Due<sup>5</sup>, R. G. Roberts<sup>3</sup>, T. Maeda<sup>3</sup>, S. Wasisto<sup>2</sup> & T. Djubiantono<sup>2</sup>

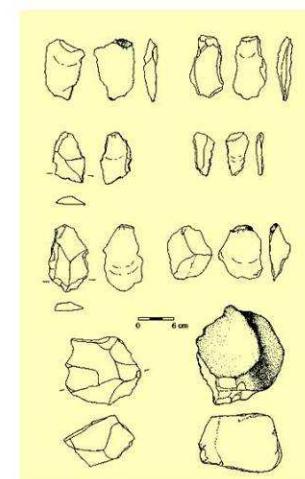

The new fossils consist of the right humerus, radius and ulna of the LB1 skeleton, the mandible of a second individual (LB6), and assorted other remains including two tibiae, a femur, two radii, an ulna, a scapula, a vertebra, and various toe and finger bones. The researchers think that the sample includes the remains of at least nine individuals.

## La questione dei manufatti

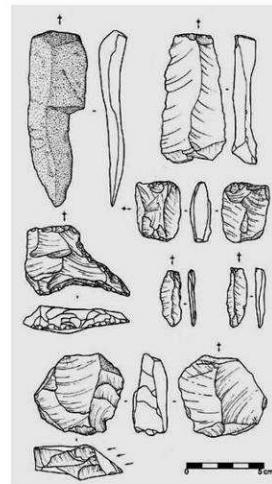

### Fission-track ages of stone tools and fossils on the east Indonesian island of Flores

M. J. Morwood<sup>1</sup>, P. B. O'Sullivan<sup>1</sup>, F. Aziz<sup>2</sup> & A. Razzaq<sup>2</sup>  
NATURE VOL 392 | 12 MARCH 1998

our findings validate generally dismissed or ignored claims (known since 1970) for the presence of hominids on Flores in the Early/Middle Pleistocene (...). sometime between 800,000 and 900,000 years ago, *Homo erectus* in this region had acquired the capacity to make water crossings.

NATURE VOL 431 | 28 OCTOBER 2004

None of the hominin remains found in the Pleistocene deposits could be attributed to *Homo sapiens*. In the absence of such evidence, we conclude that *Homo floresiensis* made the associated stone artefacts.

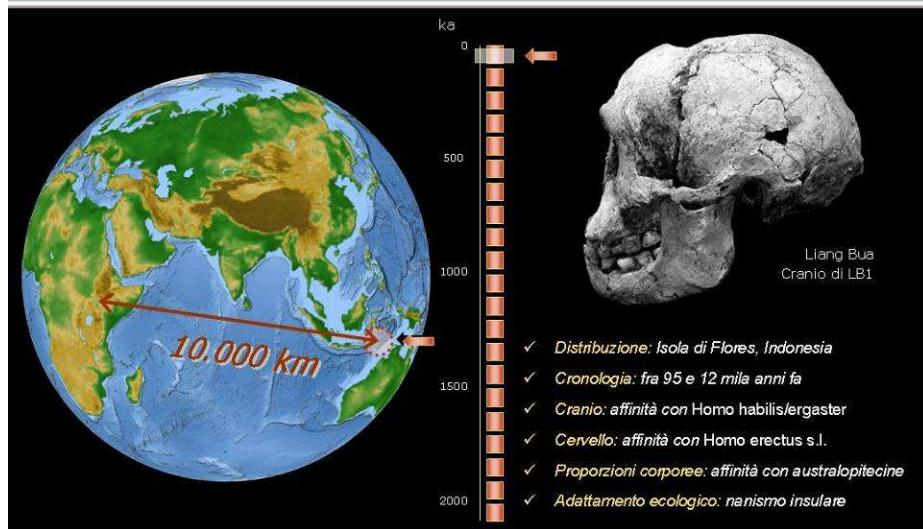

MJ Morwood et al. (2004)

Stone artefacts produced by much heavier percussion also occur in older deposits at Liang Bua. At the rear of the cave, for example, conglomerates contain stone artefacts, including a massive chopper (...) datings indicate that are older than 102.4 +/- 0.6 kyr, but we do not know which hominin manufactured these artefacts.

### Skeptics Question Whether Flores Hominid Is a New Species

12 NOVEMBER 2004 VOL 306 SCIENCE

**Teuku JACOB**  
Gadjah Mada University  
Yogyakarta (Indonesia)

Jacob, who was not a member of the team, says he has already concluded that the tiny Flores hominids belong to a population of microcephalic, pygmylike modern humans rather than to a new species.

**PETER BROWN**  
University of New England  
Armidale (Australia)

## Out - of - Africa 1

## Il cranio si conferma da "early Homo"

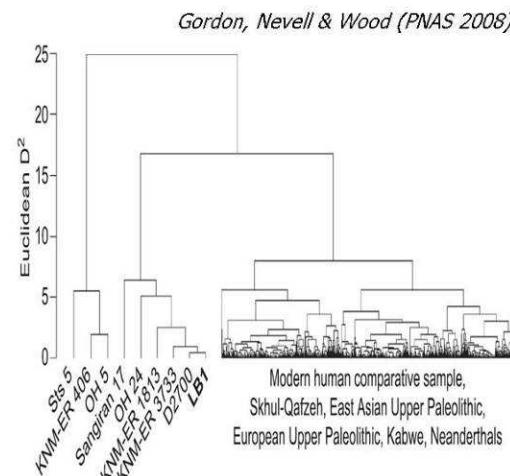

The results presented here are in broad agreement with phylogenetic scenarios suggesting that

*H. floresiensis* is the product of insular dwarfing of *H. erectus* on Flores or nearby islands

... Or that ...

*H. floresiensis* and *H. erectus* shared a recent common ancestor, possibly *H. habilis*.

The close morphological similarity between the LB1 cranium, D2700, and KNM-ER 3733 in conjunction with the lack of close similarity between these specimens and Sangiran 17 argues for an ancestry for LB1 that does not include later Asian *H. erectus*.
