

Progettazione Multidisciplinare e Carpenterie

Simulazione di **attori** nel processo progettuale e dei rispettivi **Spazi di lavoro Progettuale Personale** - **Personal Design Workspace, PeDW** (detti anche specialistici - SpDW)

Progettazione Architettonica tre approcci:

- Olistico, unicum (indistinguibili gli apporti, fusione culturale) - Partenone
- Multidisciplinare, più soggetti (ben definiti gli apporti, cooperazione) - HKSBC
- Sistemico, funzionale (sistematizzazione di apporti incrociati, transdisciplinarietà) – Guggenheim Bilbao

To simulate a CWE model we are building a toy incubator: **X**-house game

aims to study and simulate knowledge engineering tools, communication protocols and the areas of an ICT implementation

shares immediately conventional assessments of any actor's project proposals to stimulate the development of other proposals.

We conventionally define:

- actors roles: Arch., Structural Eng., Client, Energy Eng.
- game rules: moves, authority, *audience*
- modular spaces, one level, single family house
- modular components: beams, columns, walls, partitions, floors, roofs

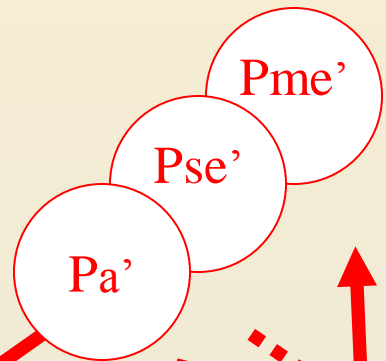

[Communicating Space(s)]

mechanical eng.

Space(s)

actors take part in the process by means of a perspective/filter

the perspective/filter works in two directions: inwards, it enriches the project core with its private knowledge; outwards, it impoverishes the actor's project

The notifications exchanged in the SDW are:

- automatic, which are triggered by the daemons and the procedural attachments;
- manual, which are published by the actors on a whiteboard.

In this way a more exhaustive exchange of knowledge is obtained which includes both the formalized aspects and the non-formalized ones.

The latter can then be formalized by means of conventions among actors using XML.

X-House – Summary - Brief

PIANO TERRA

Entrance/Lounge/Dining room:

E/S/P 50-60 m²

Kitchen

K 12-14 m²

Porch 1

P1 6-8 m²

Porch 2

P2 12-14 m²

PIANO PRIMO

Double bedroom with cupboard

LM 15-18 m²

First room with double bed

L2 13-15 m²

Second room with double bed

L2 13-15 m²

Bathroom 1 complete with shower

B1 3-4 m²

Bathroom 2 complete with bath tub

B2 4-5

Terrace 1

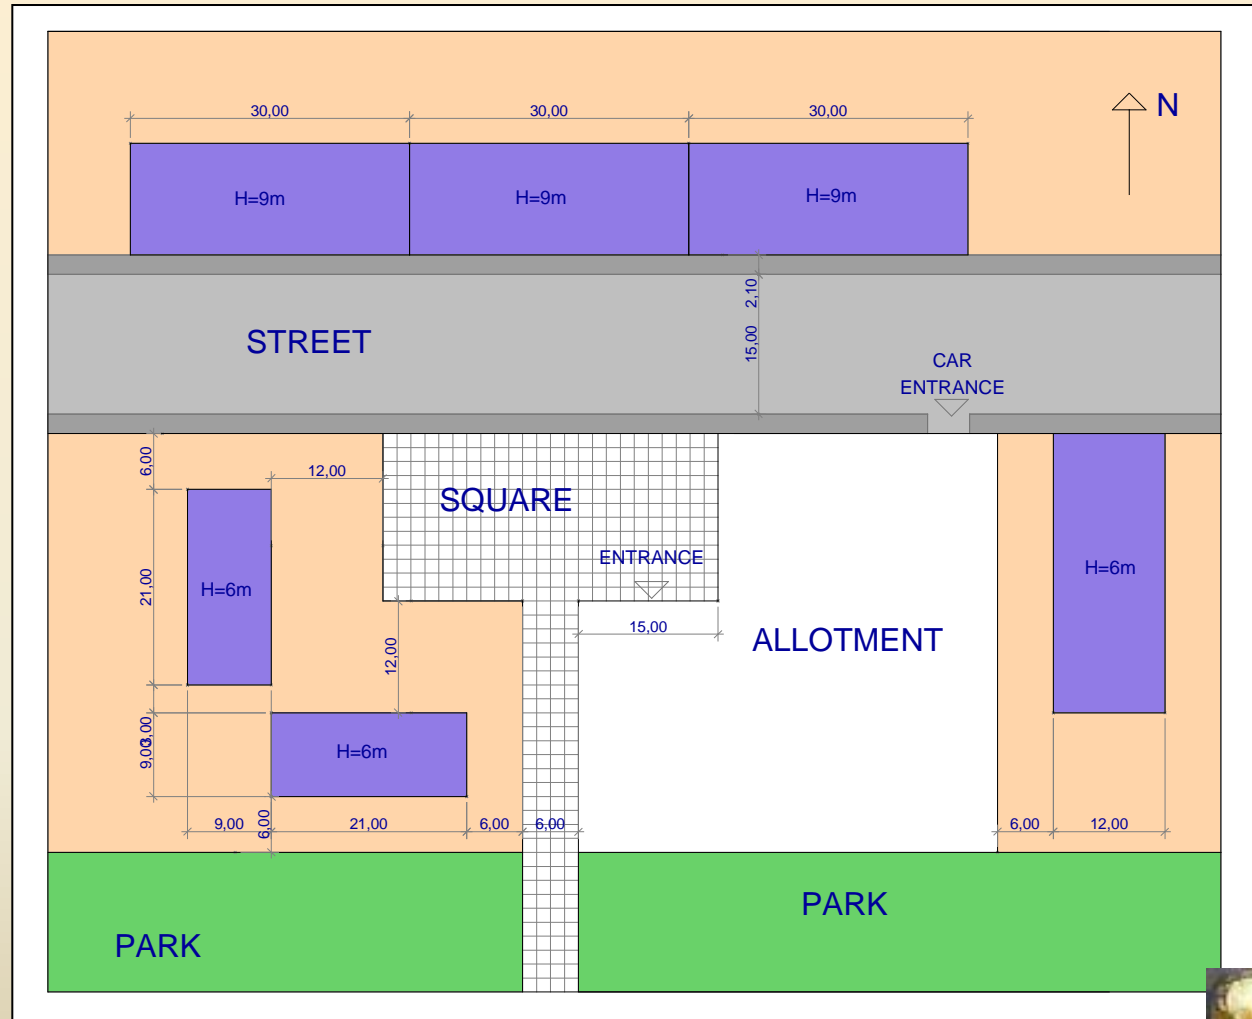

T1 9-12 m²

Terrace 2

T2 9-12 m²

Lumber room

D 5-8 m²

The project will be implemented by positioning conventional objects of a library, parameterized with a step of $1M = 10 \text{ cm}$. These objects are all reducible to a composition of parallelepipeds with a rectangular base.

Their positioning will be effected on a modular orthogonal spatial grid, also having a $1M = 10\text{cm}$ module. The axis of each parametric object will be positioned on one of the axes of the grid. The joints and tolerances are considered conventionally to the extent that the objects are all connected together with the constraint of simple adherence by contact.

The staircase is an exception to the extent that it is an object that cannot be reduced to simple straight-line prisms positioned on a spatial grid.

The first move is made by the client who entrusts the task to the architect and acts as go-between with the structural engineer and the plant engineer.

The architect implements the first drawings by positioning the axes of the wireframe objects available to him on the modular grid. Subsequently, the set of drawings will be submitted to the structural engineer and the plant engineer. After an initial revision session, the architect proceeds with his proposals.

The subsequent rules will be attributed to the individual actors, as the simulation project proceeds. No processing using IT tools is required at this stage.

 WR = Wardrobe Room

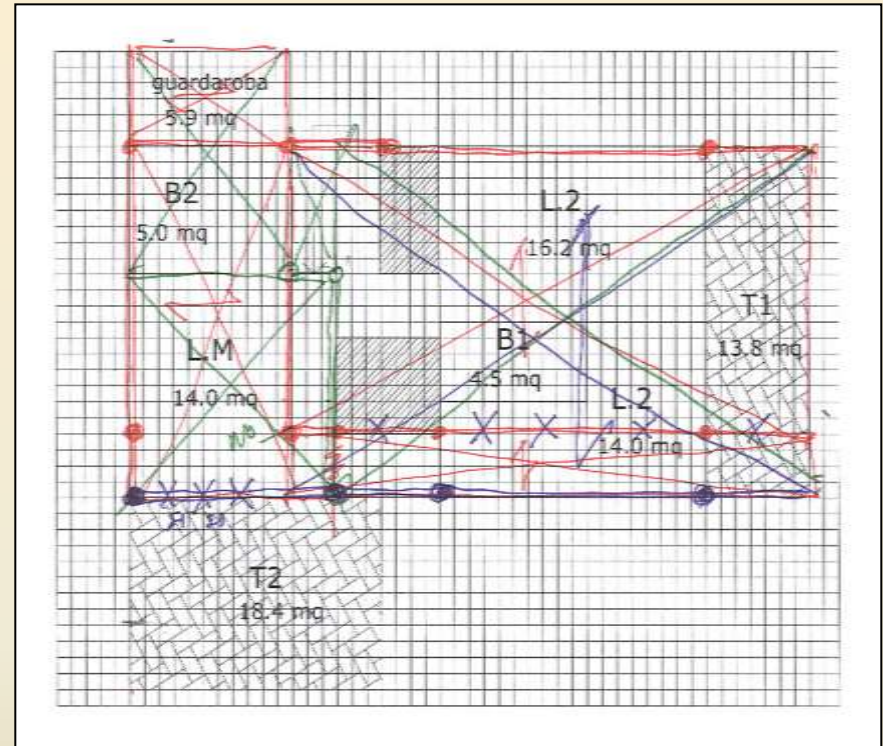

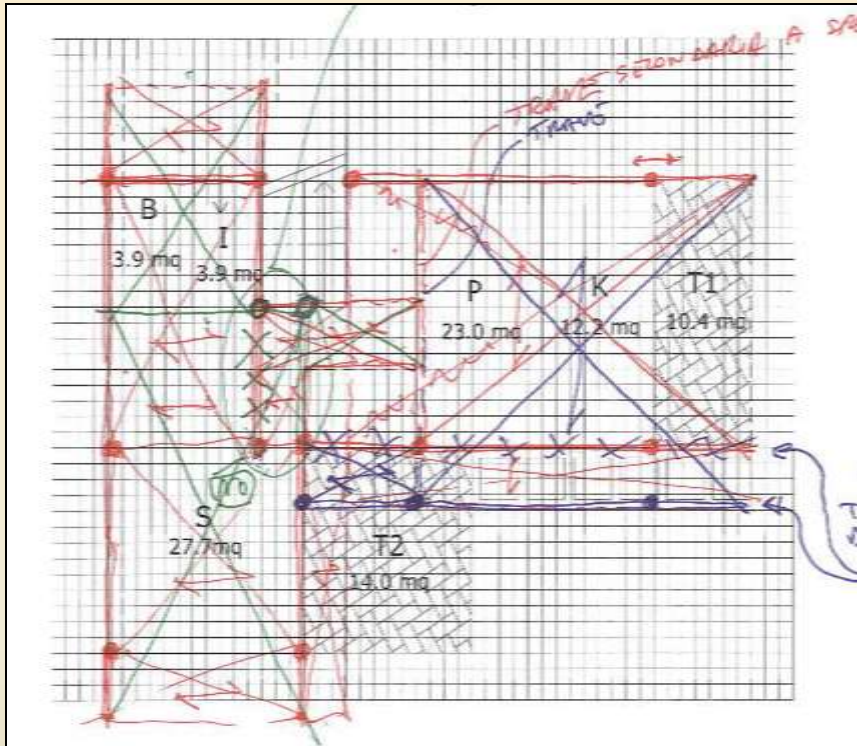

X-House – il punteggio

- Each actor, both during the development and in the final result, gives a mark.
- The score assigned to each individual project aspect is computed as the mean of the scores assigned according to criteria previously defined in a simplified and conventional manner by the individual actors
- assessment criteria and consequent scores achieved can vary in time and place, and are therefore highly contextualized. To satisfy this need different “weights” may be assigned to the scores
- The various assessments are conventional and scores assigned by the various actors are purely indicative although reasonable.
- The score for each actor ranks from 1 to 10
- luce netta del solaio < 5 m voto 8, 5m < slab < 6 m voto 7, 6m < slab voto 5
- The group wins when the overall score it reaches is over a minimum threshold related to the degree of difficulty selected; if several groups are present, the one obtaining the highest score wins

Invarianti Metodologiche

1) Impostazione delle **Linee di Costruzione**

1a) Linee di Costruzione per ciascun “attore di spazi”, “attore di strutture”, “attore di impianti”

1b) Linee di Costruzione di un attore

Differente orientazione

Differente spaziatura

2) Identificazione degli **spazi funzionali** e **vuoti** nello schema delle piante ignorando quelli identificati dagli altri attori

2a) Identificazione degli spazi funzionali e vuoti in elevazione (dalla sezione)

ignorando quelli identificati dagli altri attori

3) Allineamento delle Linee di Costruzione di volumi “pieni” (pareti opache)

3a) Allineamento di Linee di Costruzione di volumi “vuoti” (pareti trasparenti)

L'attore nel suo "Spazio di Lavoro Progettuale Personale" -PeDW,
per semplificare il suo lavoro opera sia su rappresentazioni volumetriche,
sia su superfici piane, attraverso una continua transizione tra queste,
associate o meno a programmi S/W

- 4) individuazione di "alcune" Linee di Costruzione che chiaramente non aumentino conflitti
 - 4a) Identificazione di Linee di Costruzione critiche = non allineamento di aree critiche
 - 4b) proposta di Linee di Costruzione alternative
- 5) impostazione sulle Linee di Costruzione alcuni punti fissi e altri variabili ove far convergere i carichi verticali
 - 5a) così definiti gli interasse si predimensionano le varie sezioni
- 6) Successivamente sistemazione delle travi o...
 - 6a) rivalutazione delle scelte strategiche
- 7) Spostamento delle Linee di Costruzione e gli spazi per regolarizzare i campi e "risquadrare" (regolarità geometrica ortogonale)
 - 7a) Inserimento di altri pilastri per evitare "rappezzi" e regolarizzare i campi strutturali
