Falls and Syncope in the Elderly

Prof. Gianfranco Piccirillo MD, PhD
Dipartimento di Scienze Cardiovascolari, Respiratorie,
Neurologiche, Anestesiologiche e Geriatriche
Anno Accademico 2019/2020

SAPIENZA
UNIVERSITÀ DI ROMA

falls in geriatric age

PROBLEM'S PERCEPTION

- 30% of over 65 ys old subjects
- 40% of over 80 ys old subjects
- more than 60% of istutionalized old subjects experience at least one fall

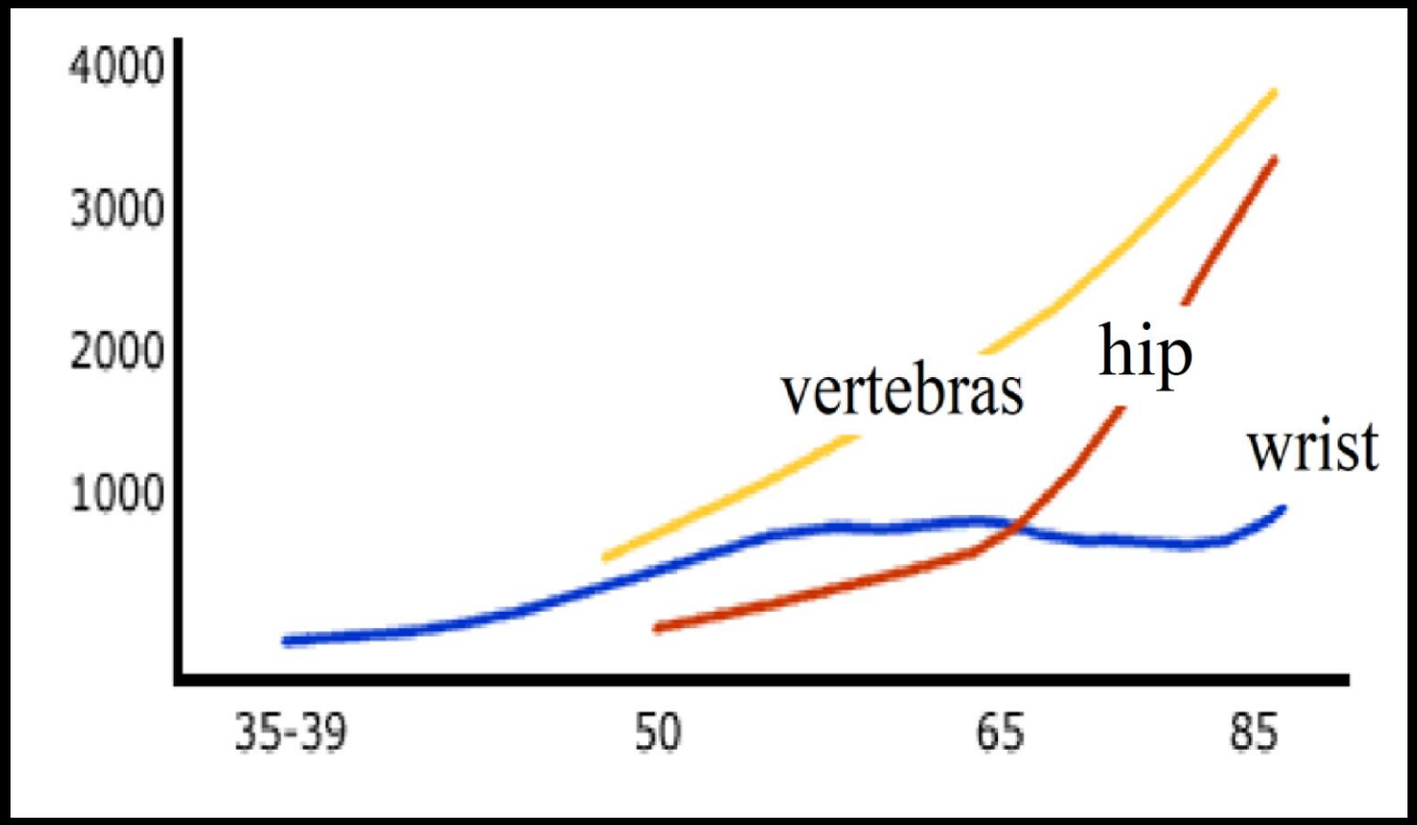
WHERE DO THEY FALL?

- 60% at the home
- 30% in the public area
- 10% residential facilities

FALL CONSEQUENCES

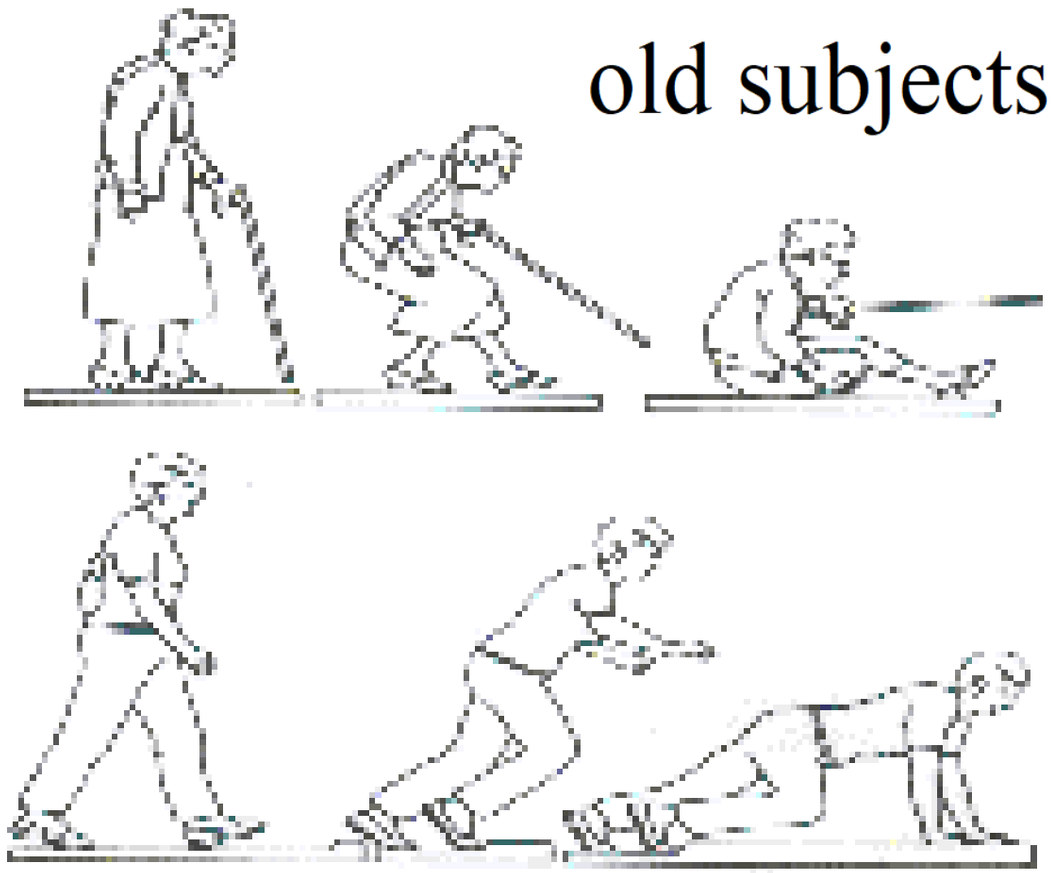
- 65 % of 75 ys old subjects deceased after fall
- skeletric fracture is the likely outcome
- 75 % of the elderly patients with hip fracture dies within 1 year

Age related incidence of fractures



IMPORTANT CONCOMITANT CAUSE OF ELDERLY FRACTURES IS OSTEOPOROSIS

old subjects

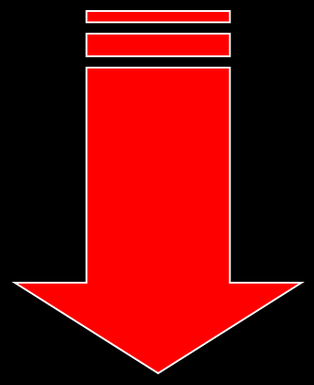


young subjects

PSYCOLOGICAL CONSEQUENCES

- post-trauma anxiety-depression
- loss of self-confidence
- loss of functional independence

PREVENTION OF ELDERLY FALLS



PREVENTION

MORBIDITY

MORTALITY

CAUSES OF FALLS IN THE ELDERLY

- Accidental falls
- Syncope or presyncope

CAUSES OF FALLS IN THE ELDERLY

Accidental fall

Syncope or presyncope

RISK FACTORS OF ACCIDENTAL FALLS IN THE ELDERLY

- Intrinsic factors
- Estrisic factors

Intrinsic Factors	RR
Muscle weakness	4,4
History of falls	3
Gait disturbances	2,9
Balance impairment	2,9
Use of mobility aids	2,6
Visual impairment	2,5
Joint diseases	2,4
ADL reduction	2,3
Depression	2,2
Cognitive impairment	1,8
Over 80 ys old	1,7

POSTURE AND AGING

- Postural stability perception
- Muscle strength (sarcopenia)
- Balance perception
- Latency times (reduction of nerve conduction velocity)
- Ability to adapt to changes in objectives and supports

FALLS

Estrinsic factors
Drug therepy (antihypertensive, sedative-hypnotic, hypoglycaemic drugs…)
Home (lighting, floors, carpets, tables, steps…)
Outdoor (sidewalks, curbs, holes, hollows…)
Clothes (shoes, slippers..)

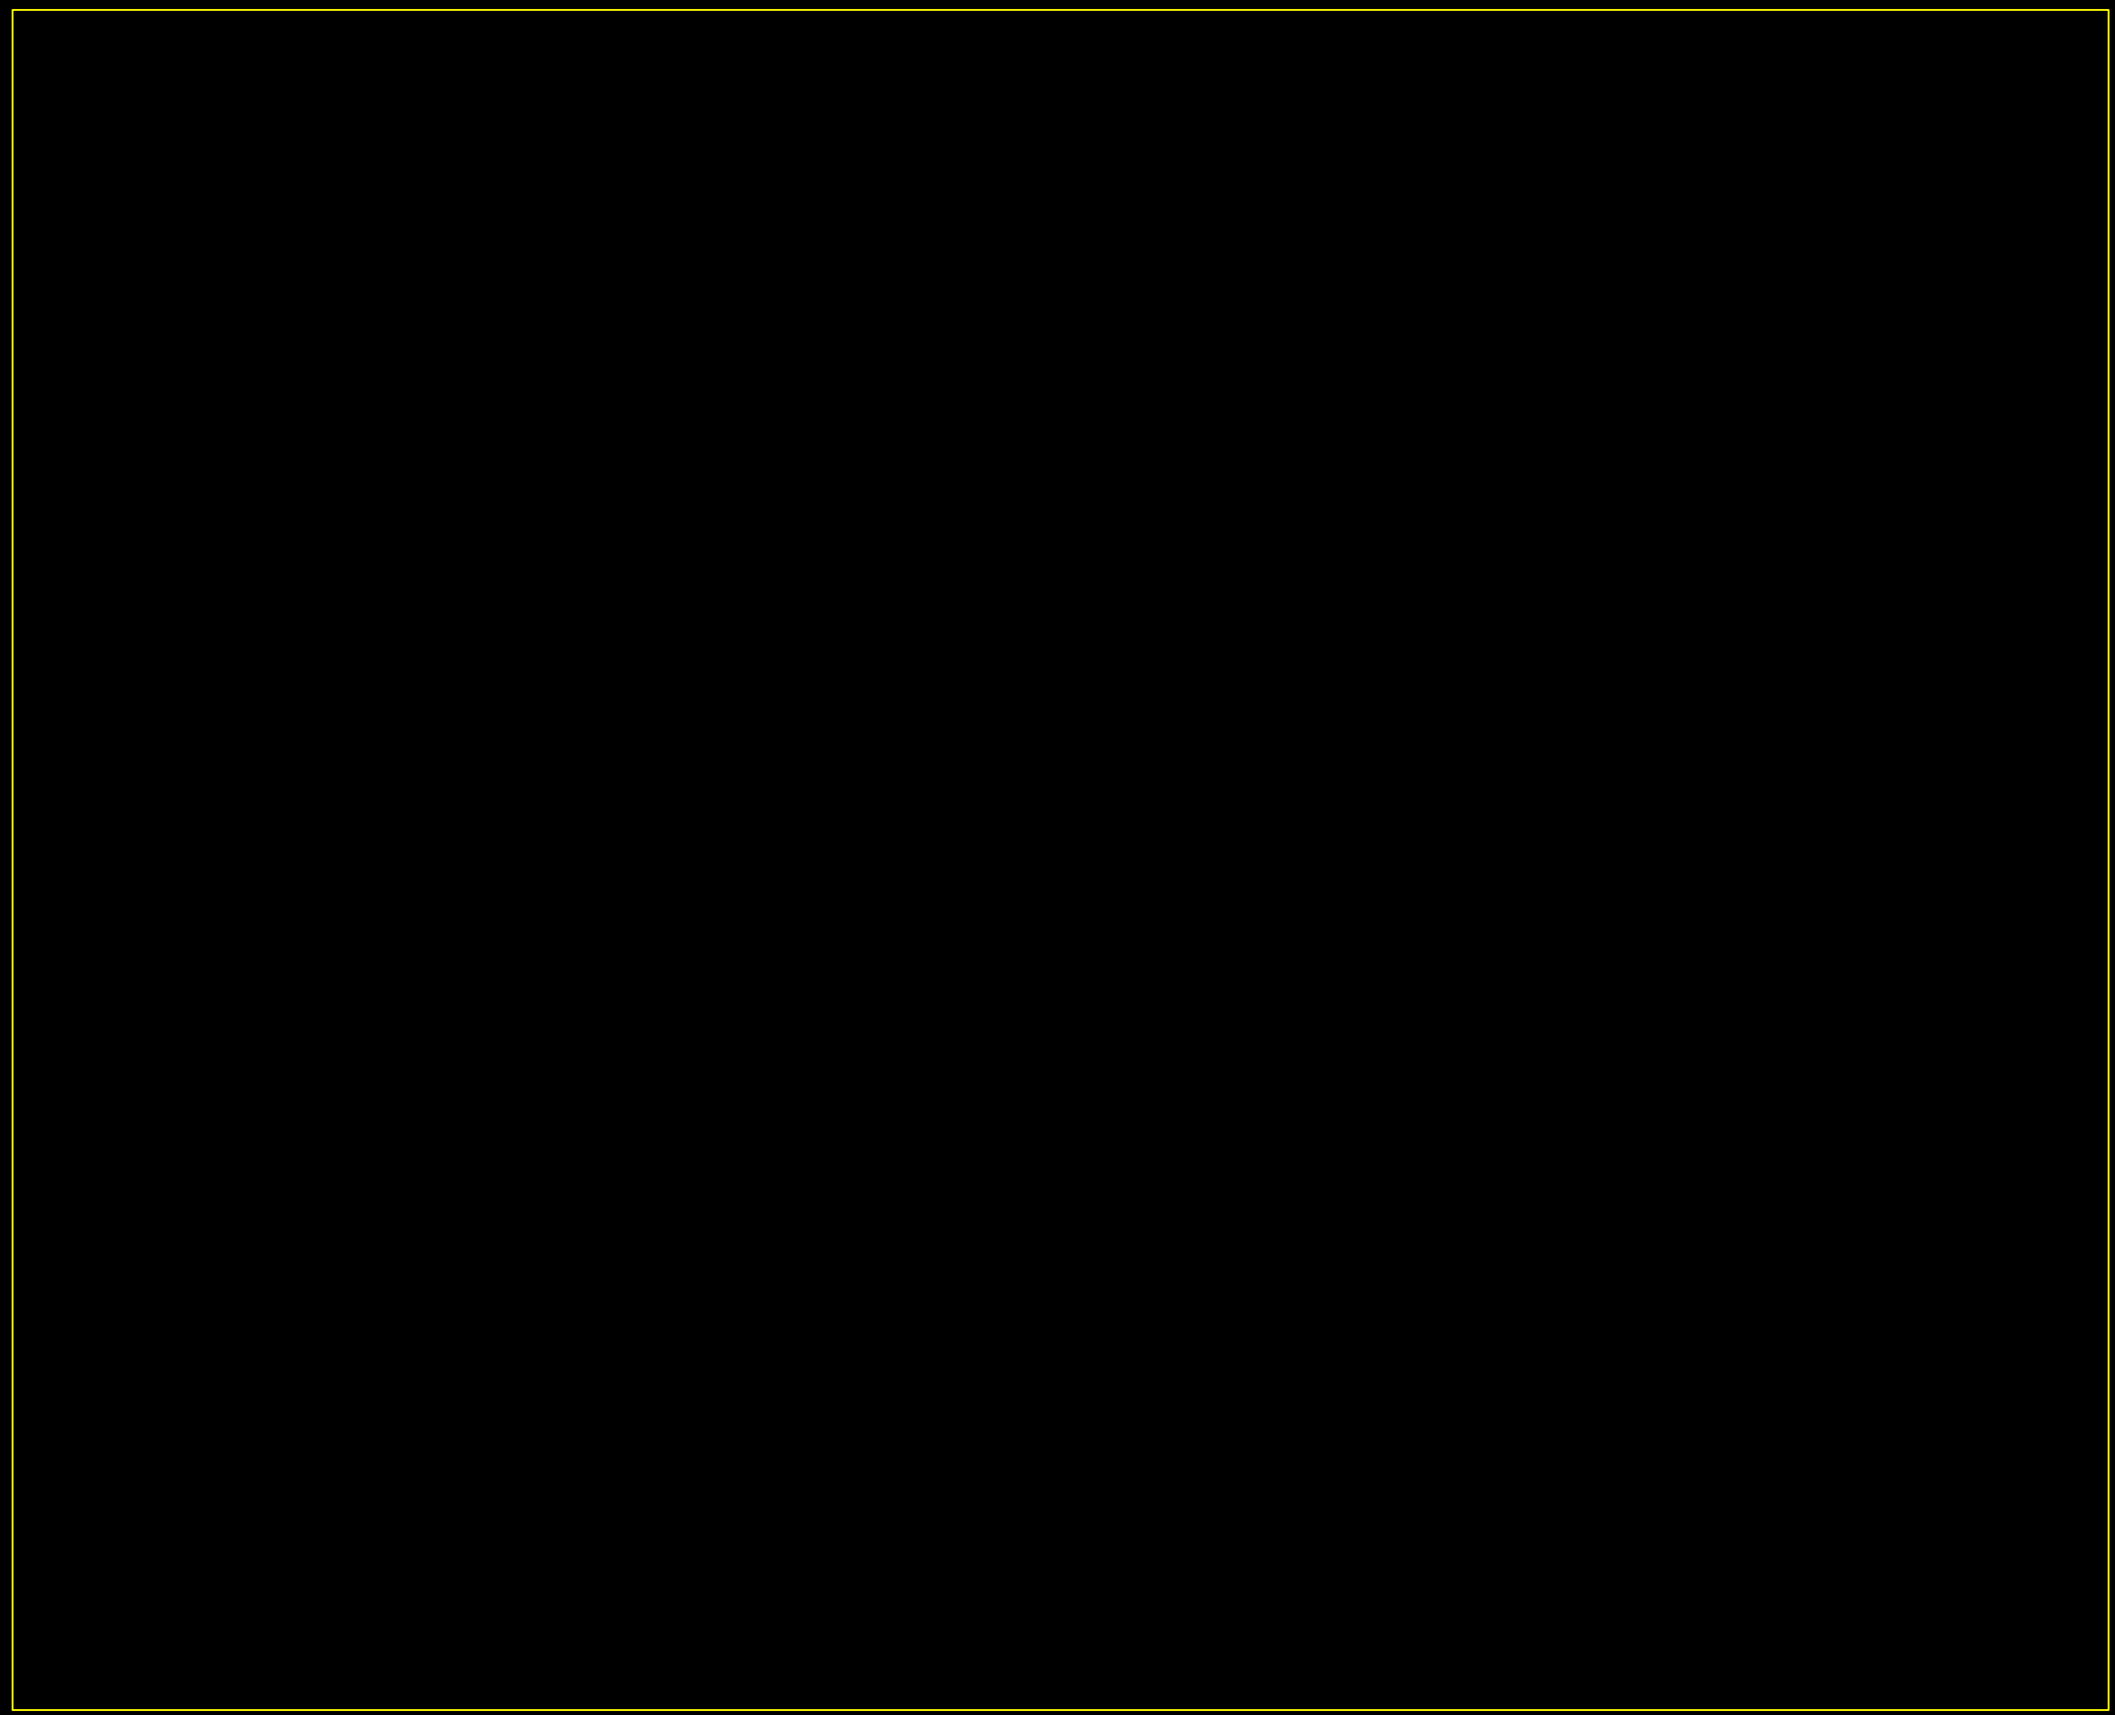
EVALUATION OF FALL RISK

- Chair standing test
- Standing Balance Test
- Timed Walking

Guralnik 1994

- Balance assessment
- Gait assessment

Tinetti 1987



CAUSES OF FALLS IN THE ELDERLY

Accidental falls

Syncope or presyncope

SYNCOPE DEFINITION

Syncope is a syndrome characterized by a transient self-limited episode of loss of consciousness (LOC) occurring as a result of a brief interruption of oxygen supply to the brain.

Pre-Syncopal Symptoms

Pre-syncopal symptoms are characterized by a sudden sense of generalized weakness with the patient feeling as if their legs woulden't carry them anymore, a black veil before the eyes or blurred vision, tinnitus, sometimes heart palpitations or sweating. Any or all of these symptoms appear suddenly concomitantly with an imminent fainting sensation but disappear spontaneously, usually in less than a minute.

CONDITIONS INCORRECTLY DIAGNOSED AS SYNCOPE

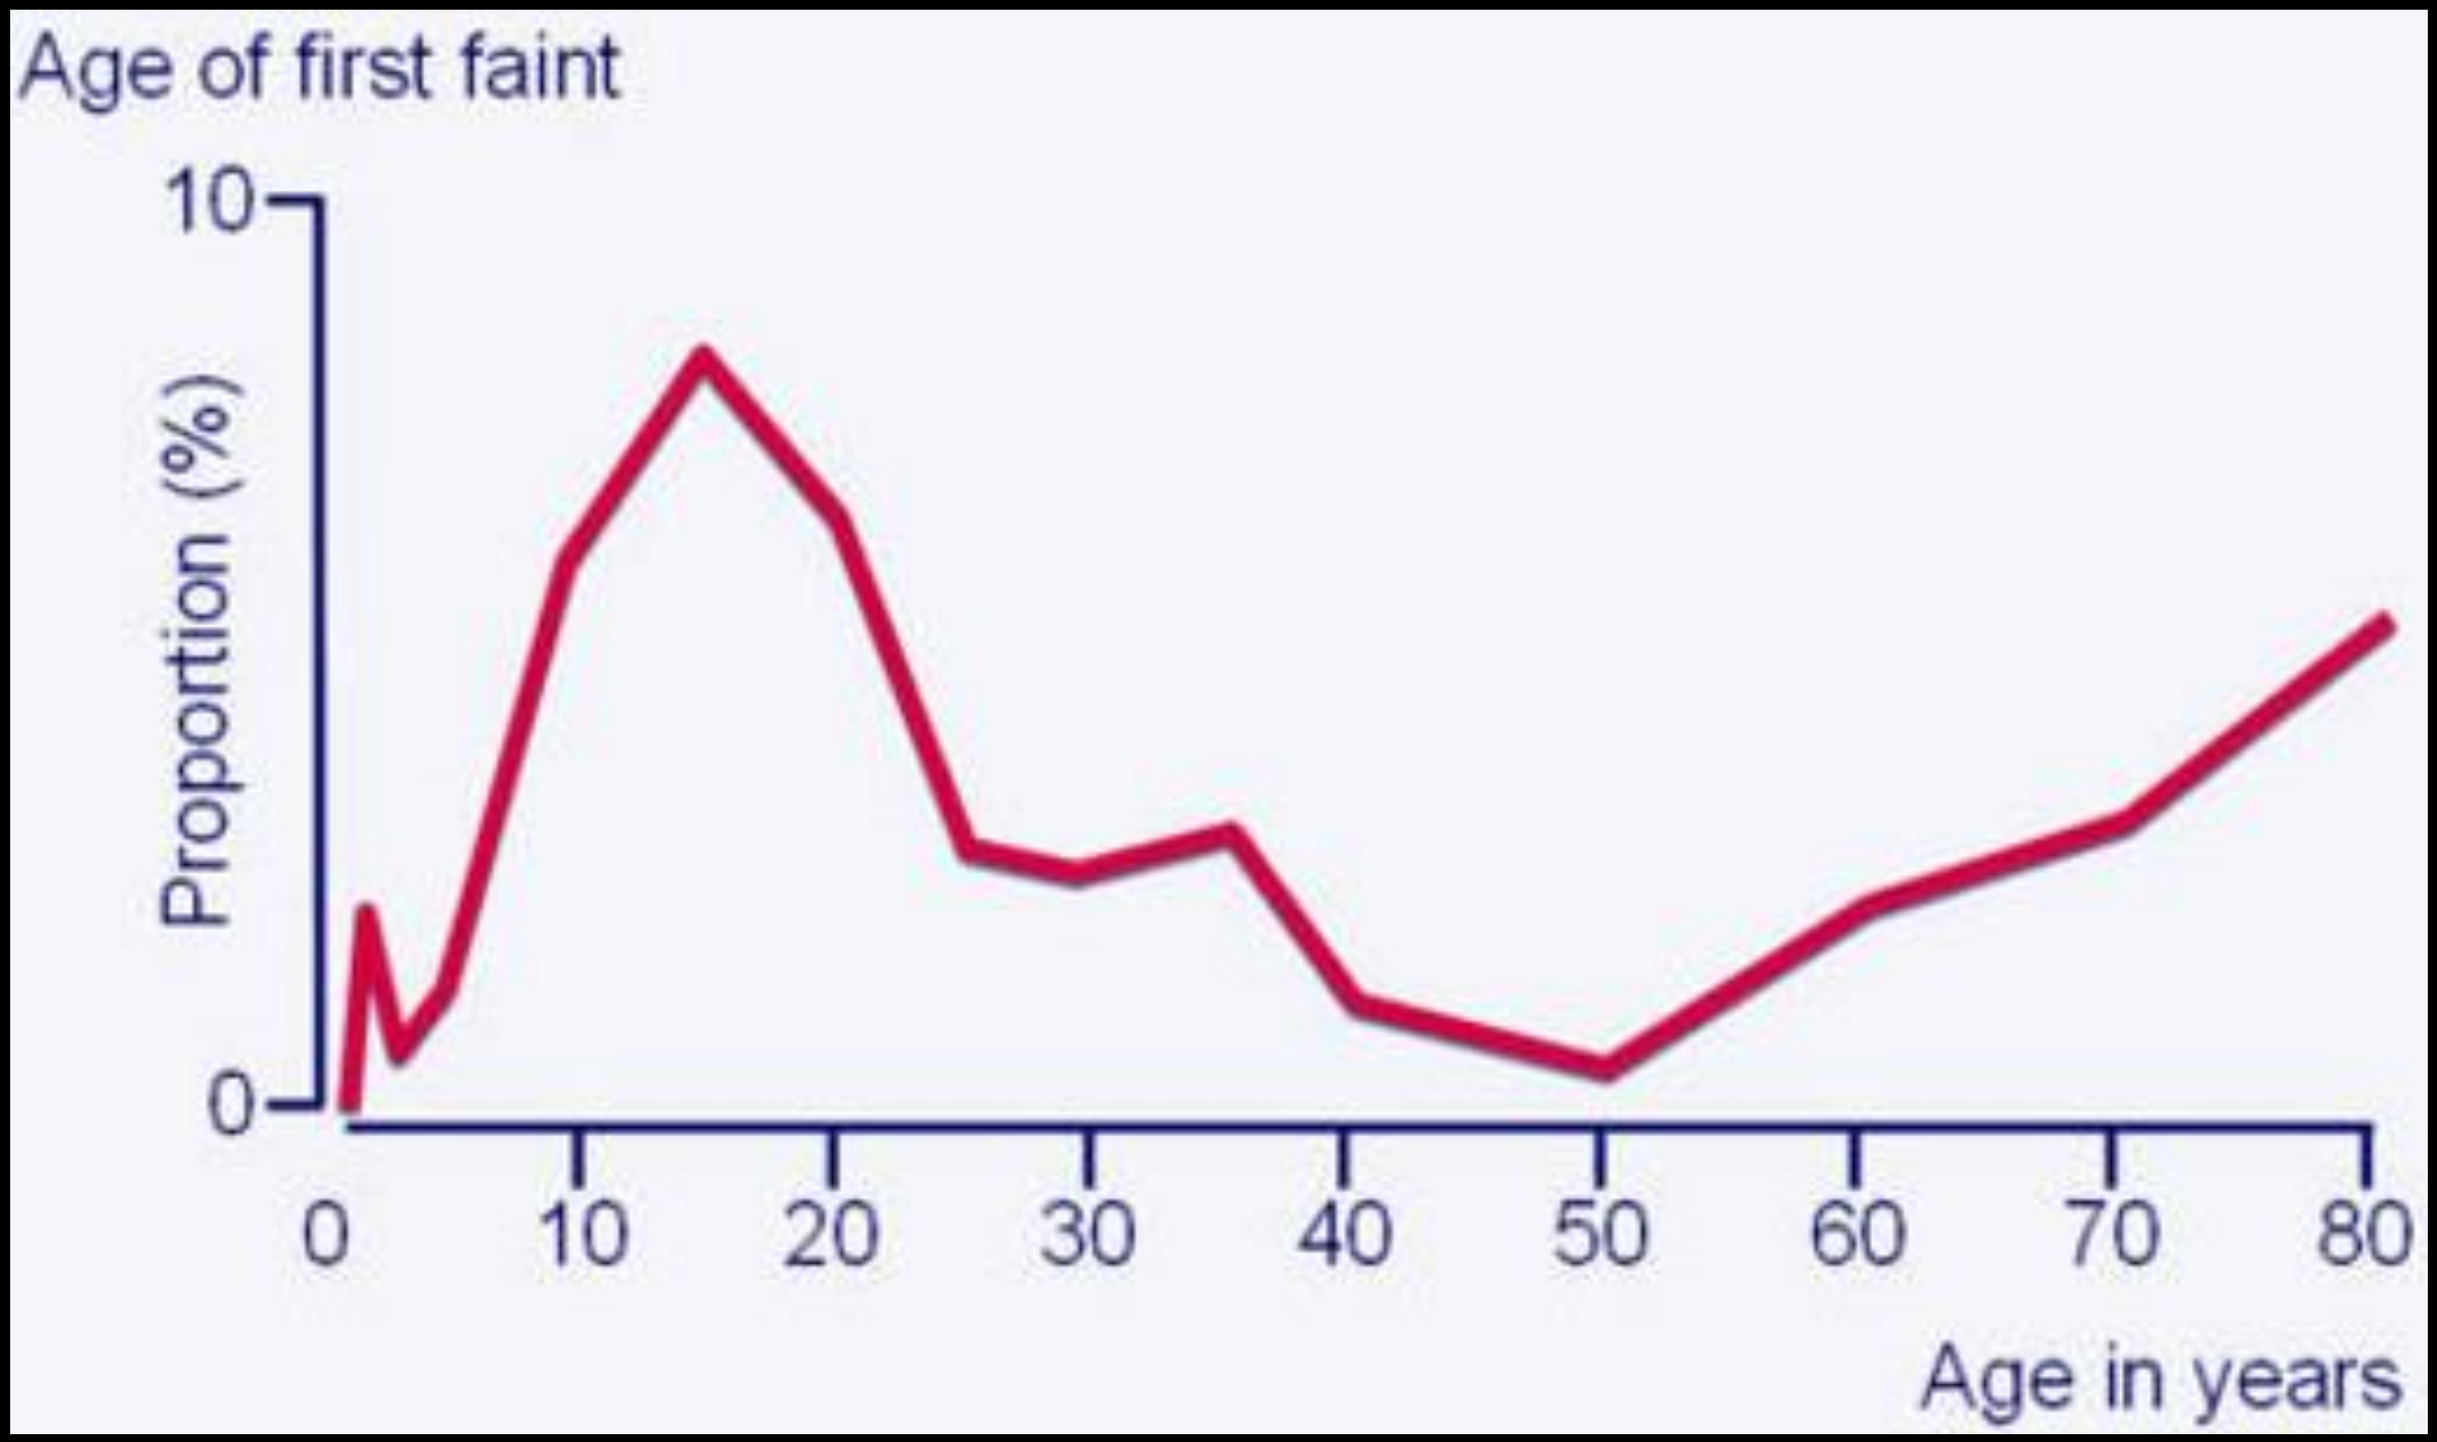
Disorders with partial or complete LOC but without global cerebral hypoperfusion

- Epilepsy
- Metabolic disorders including hypoglycemia, hypoxia, hyperventilation with hypocapnia
- Vertebrobasilar TIA

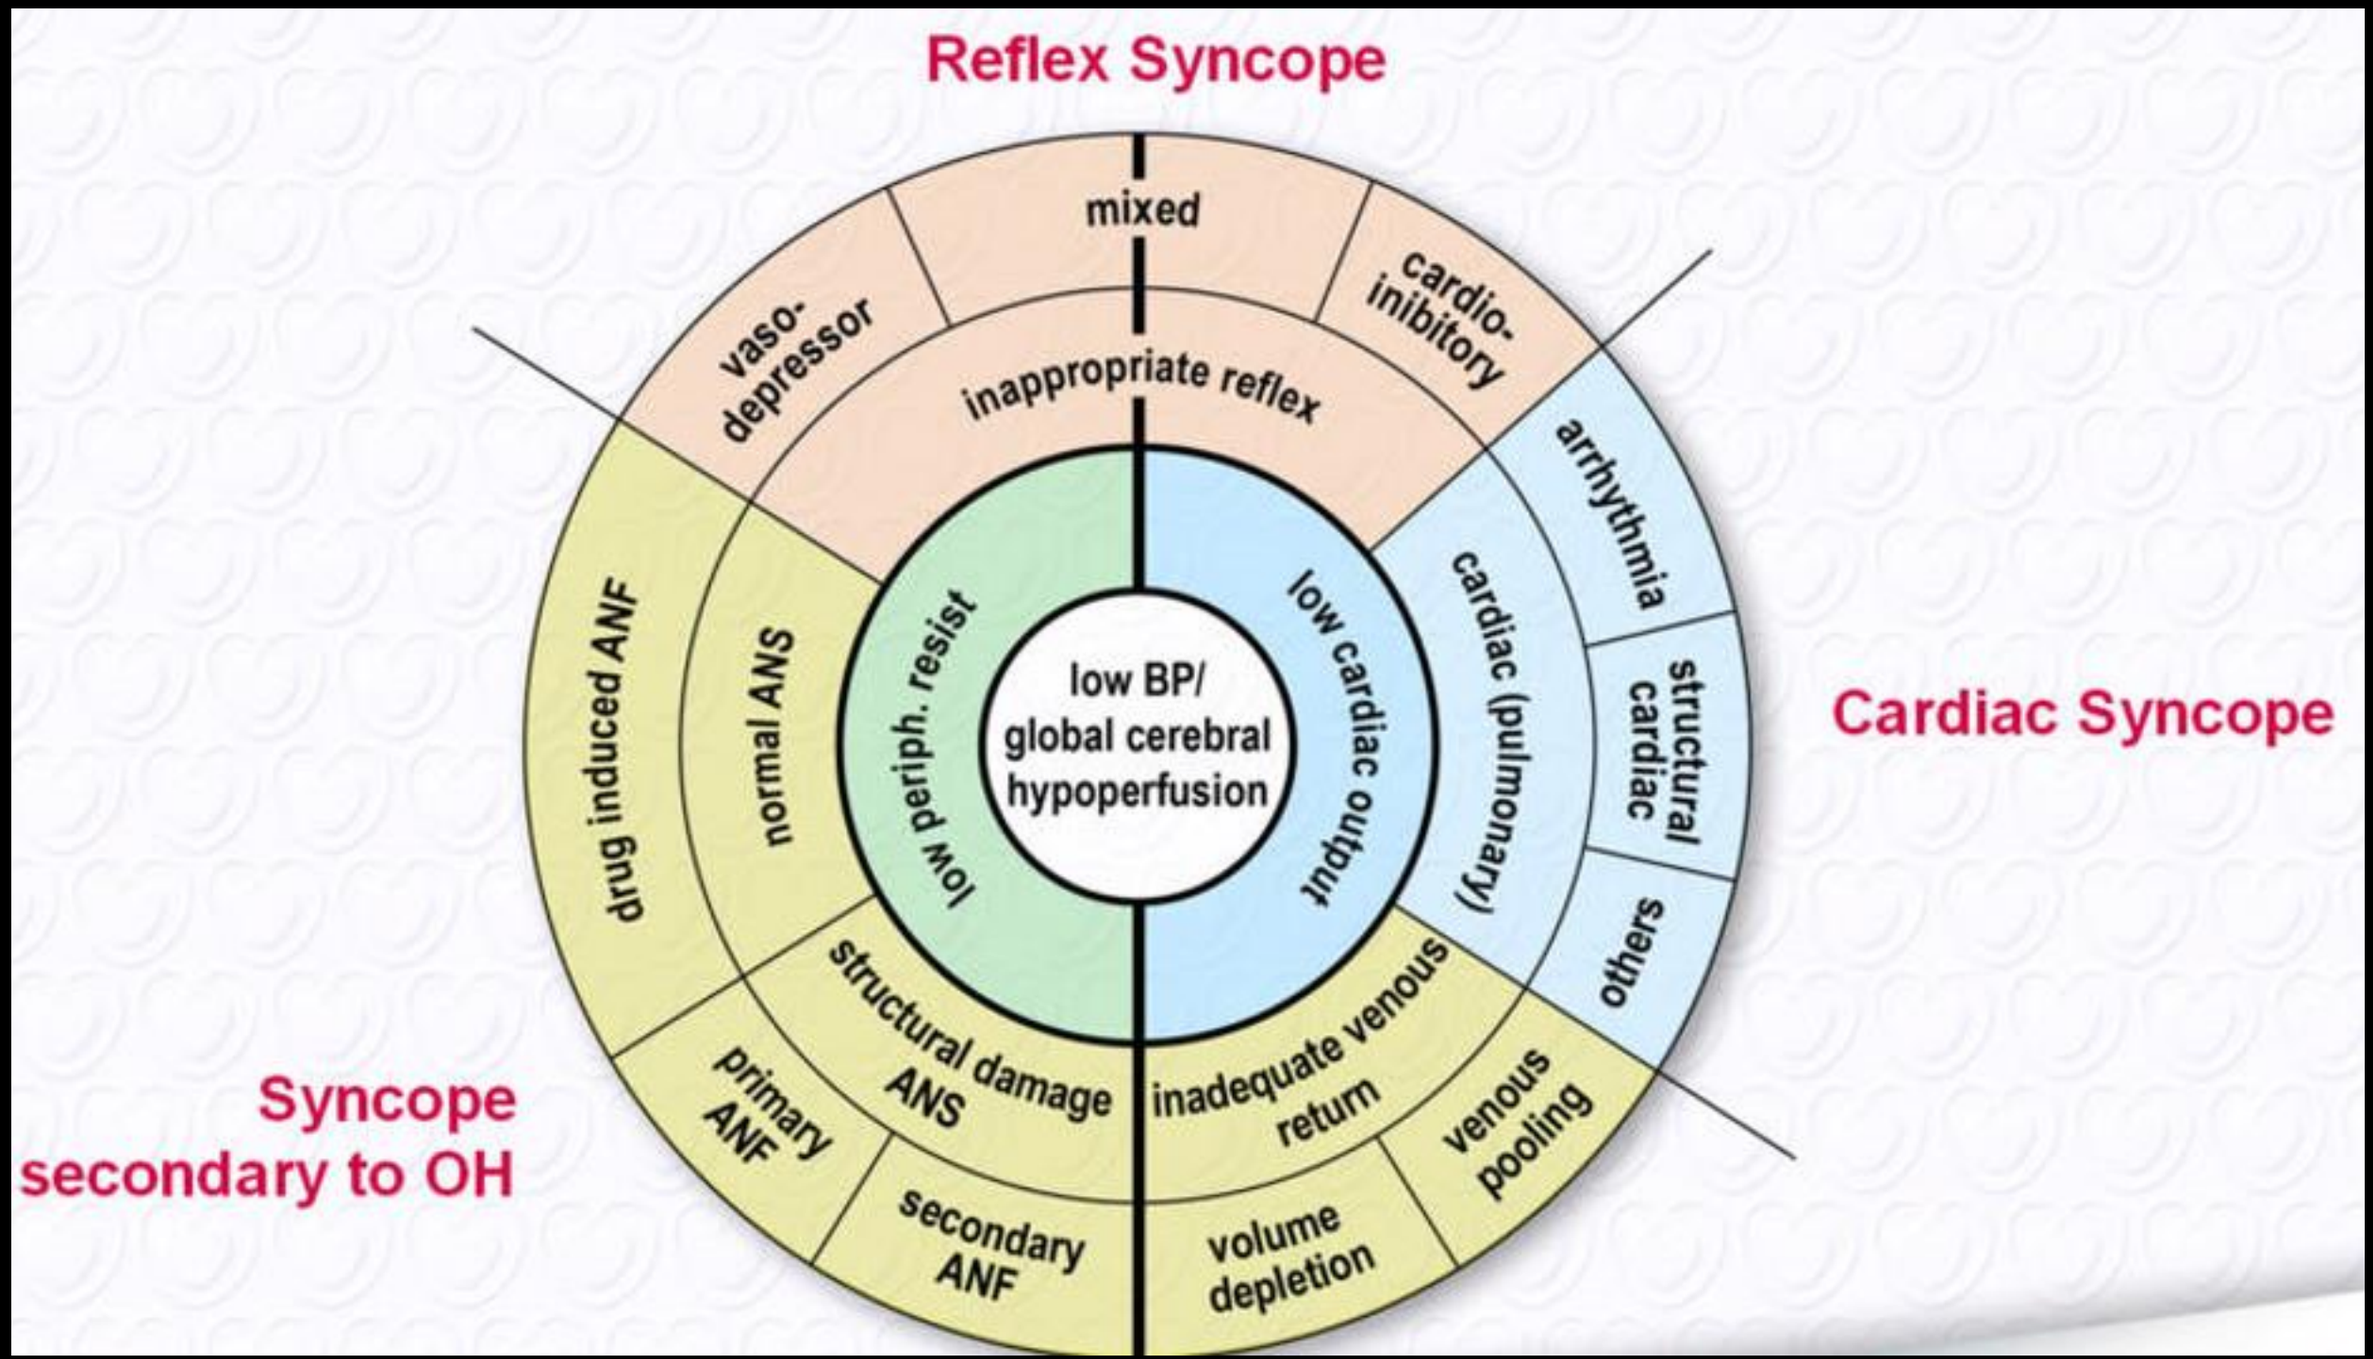
Disorders without impairment of consciousness

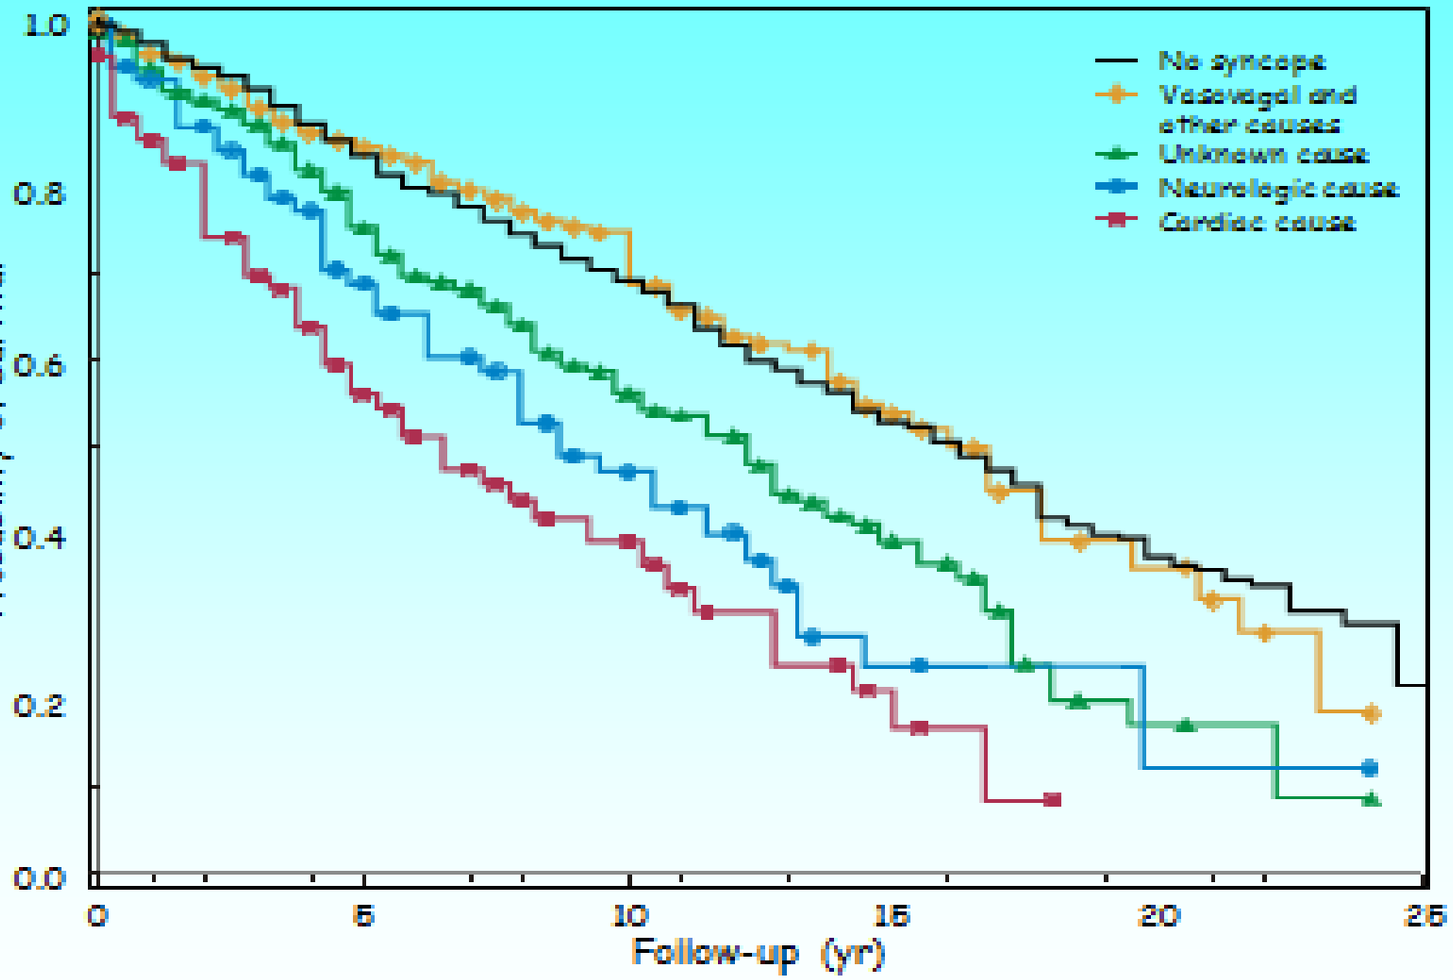
- Cataplexy
- Drop attacks
- Falls
- Functional (psychogenic psedosyncope
- TIA or carotid origin

Schematic presentation of the distribution of age and cumulative incidence of first episode of syncope in the general population from subjects up to 80 years



CLASSIFICATION AND PATHOPHYSIOLOGY





Soteriades ES, Evans JC, Larson MG, et al. NEJM. 2002;347:878-85.

INITIAL EVALUATION

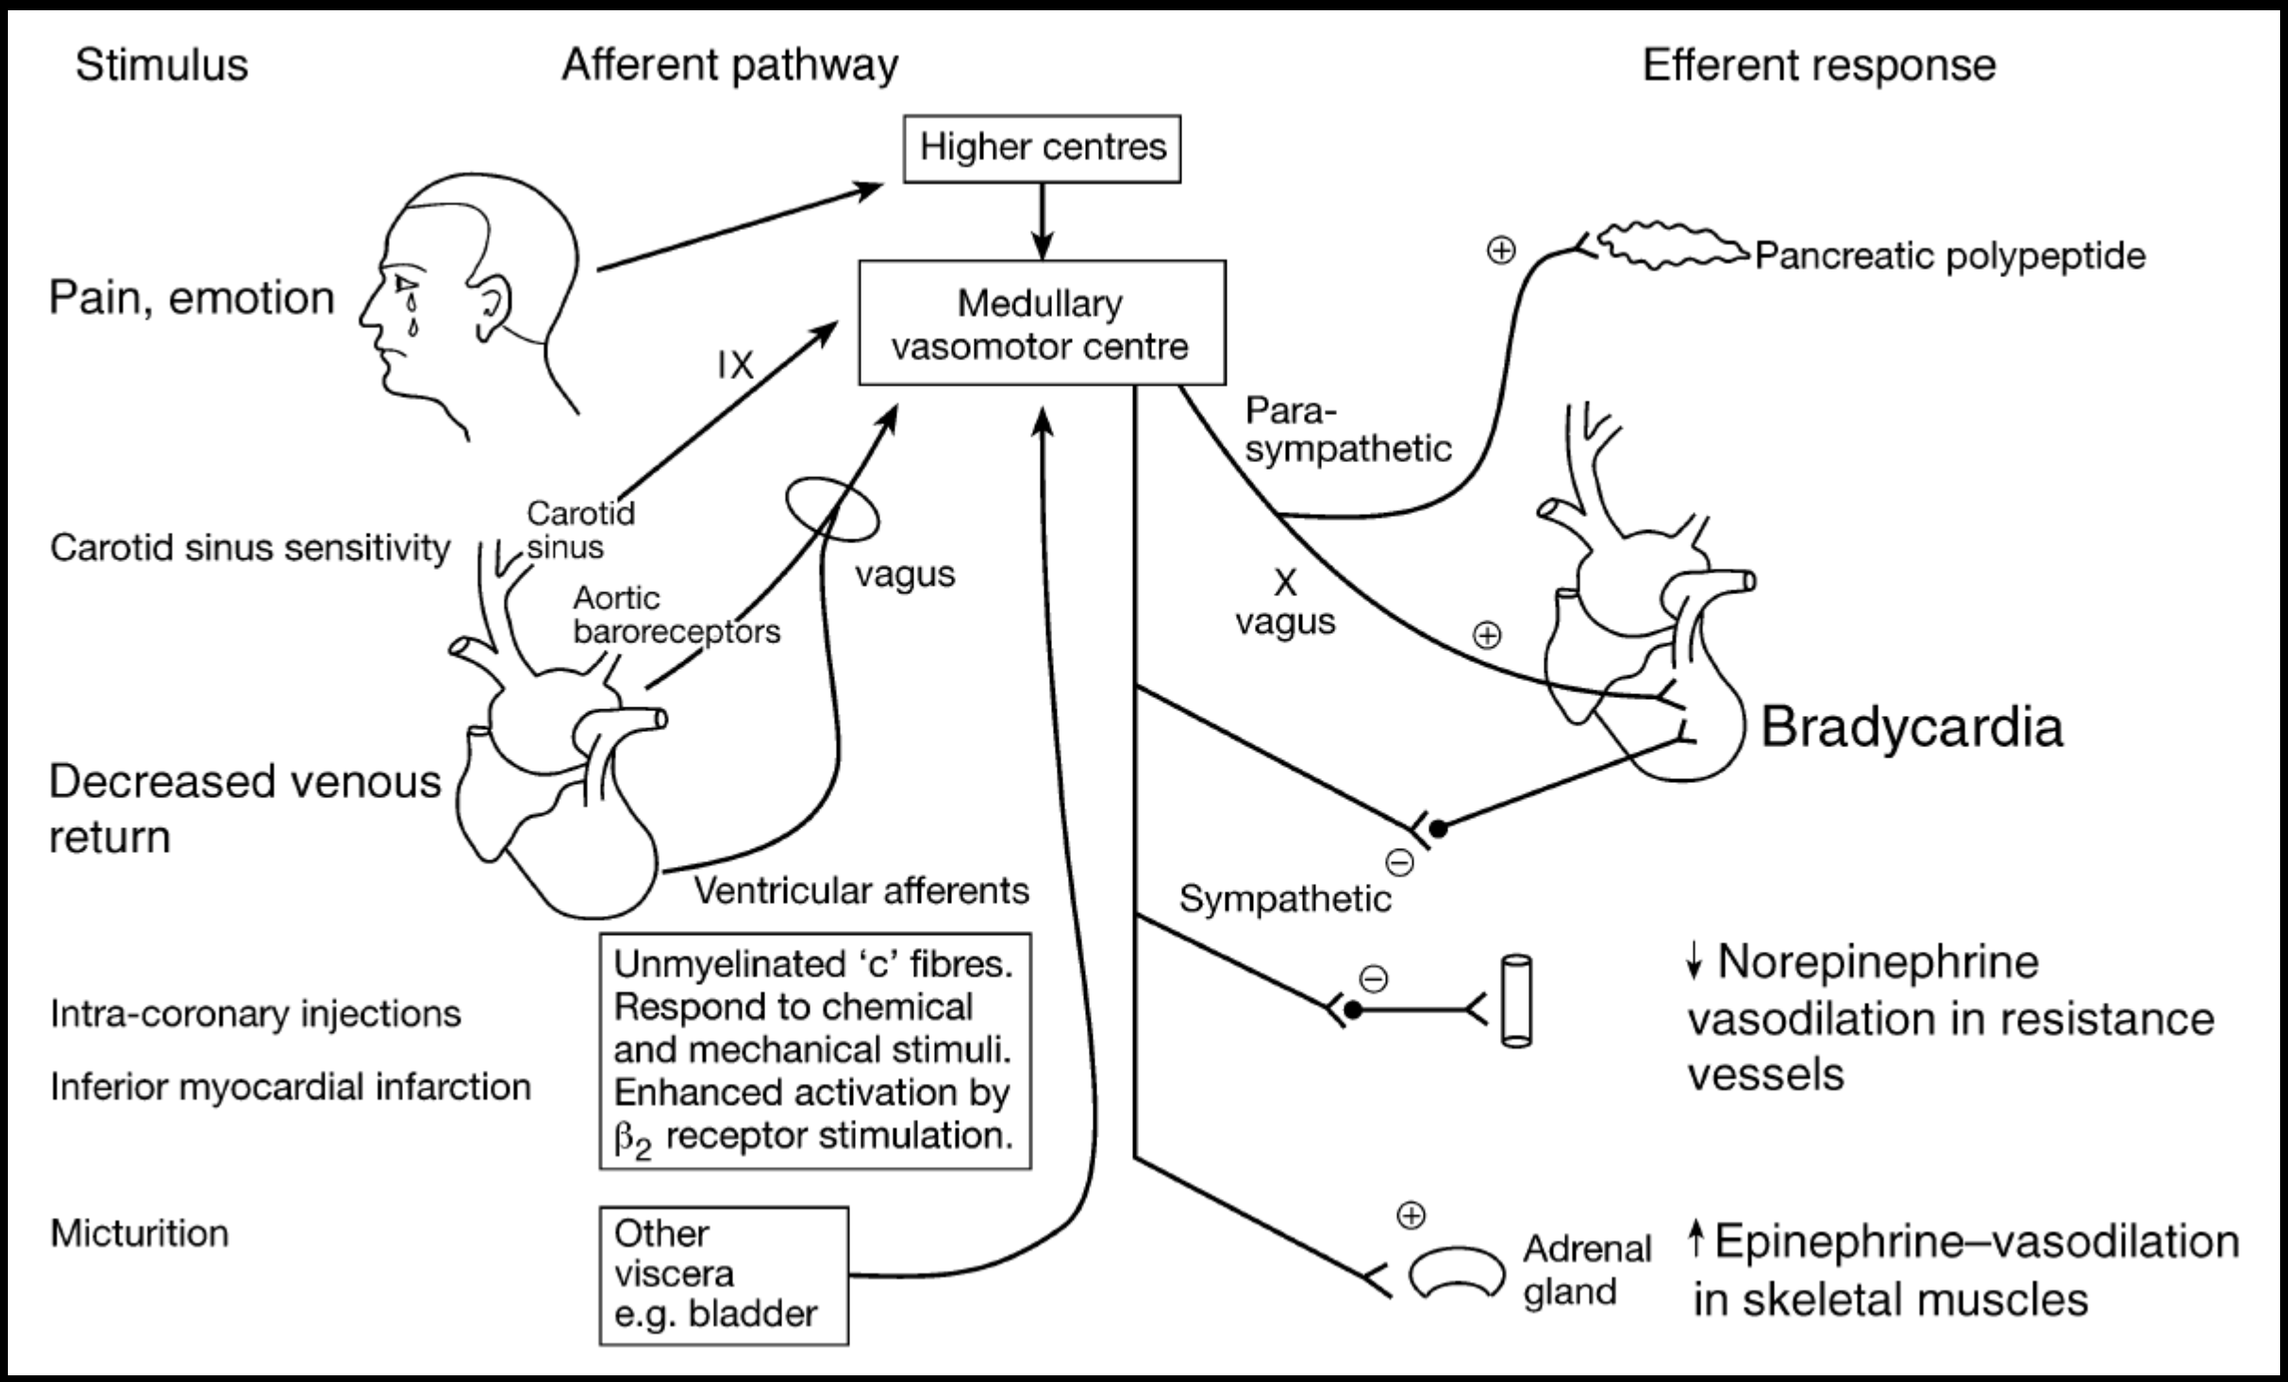
THE INITIAL EVALUATION OF A PATIENT PRESENTING WITH T-LOC CONSISTS OF:

- A CAREFUL HISTORY,
- PHYSICAL EXAMINATION,
- BP MEASUREMENT,
- ECG.

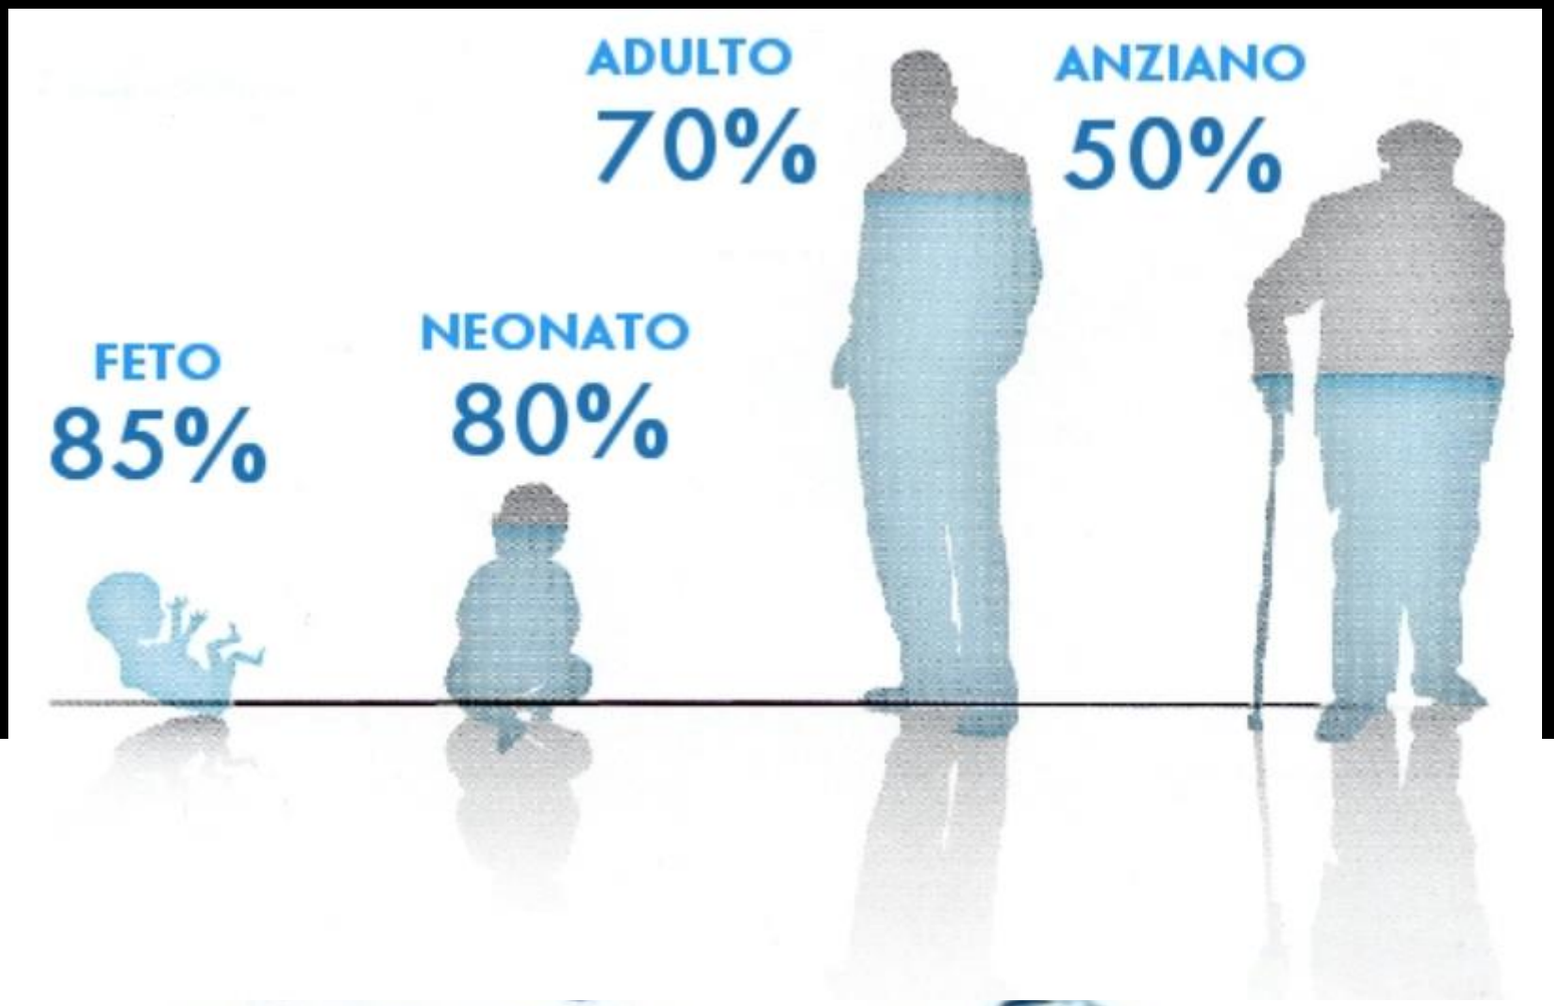
Neurally-mediated syncope	Orthostatic hypotension syncope	Arrhitmics syncope	Cardiopulmonary syncope	Neurological syncope
• Vasovagal • Carotid sinus hypersensitivity • Situational	• Pure autonomic failure (PAF, MSA, m. Parkinson, Lewy body dementia • Secondary autonomic failure(diabetes, kidney failure,…) • Drugs	• Bradycardia syndrome (sick sinus syndrome) • Tachicardia syndrome	• Aortic stenosis • AMI • Acute Cor Pulmonale • Pulmonary hypertension	• Vascular thievery • TIA • Ictal bradycardia
56%	2%	20%	3%	1%

18% unknown causes

JACC 2001; 37: 1921-1928



Kinsella SM Br J Anaesth. 2001;86(6):859-868



DISIDRATAZIONE

CAROTID SINUS SYNDROME (CSH)

Recurrent syncope due to excessive bradycardia and/or hypotension
in response to carotid sinus stimulation with no other apparent attributable cause of syncope.

In older people there is significant overlap between the symptoms of falls and syncope, this has been particularly demonstrated in CSH where older people with the reproducibly abnormal bradycardic response present with falls rather than syncope.

DIAGNOSTIC TESTS

Carotid sinus massage (CSM)

- Indications:

- >40 years with syncope of unknown etiology after initial evaluation.

- Controindications:

- CSM should be avoided in patients with previous TIA or stroke within the past three months and in patients with carotid murmurs

- Diagnostic criteria:

CSM is diagnostic if syncope is reproduced in presence of asystole longer than 3s and/or fall in SBP >50 mmHg

Vasovagal syncope

In older adults vagal tone is reduced.
Vasodepressor syncope is much more common without classical prodromal features such as nausea, pallor and diaphoresis.

DIAGNOSTIC TEST
Tilt testing

- <u>Indications:</u>

- In case of unexplained single syncopal episode in high-risk settings or recurrent episodes in the absence of organic heart disease, after cardiac causes of syncope have been excluded.
- When it is needed to demonstrate susceptibility to reflex syncope to the patient
- To discriminate reflex and OH syncope.
- For differentiating syncope with jerking movements from epilepsy
- For evaluating patients with recurrent unexplained falls
- For evaluating patients with frequent syncope and psychiatric disease

DIAGNOSTIC TEST

Tilt testing

- Methodology

- Supine pre-tilt phase of at least 5 min
- Tilt angle between 60° to 70°, is recommended
- Passive phase of a minimum of 20 min and a maximum of 45min, is recommended
- For nitroglycerine, a fixed dose off 300/400 mcg sublingually administered in the upright position, is recommended

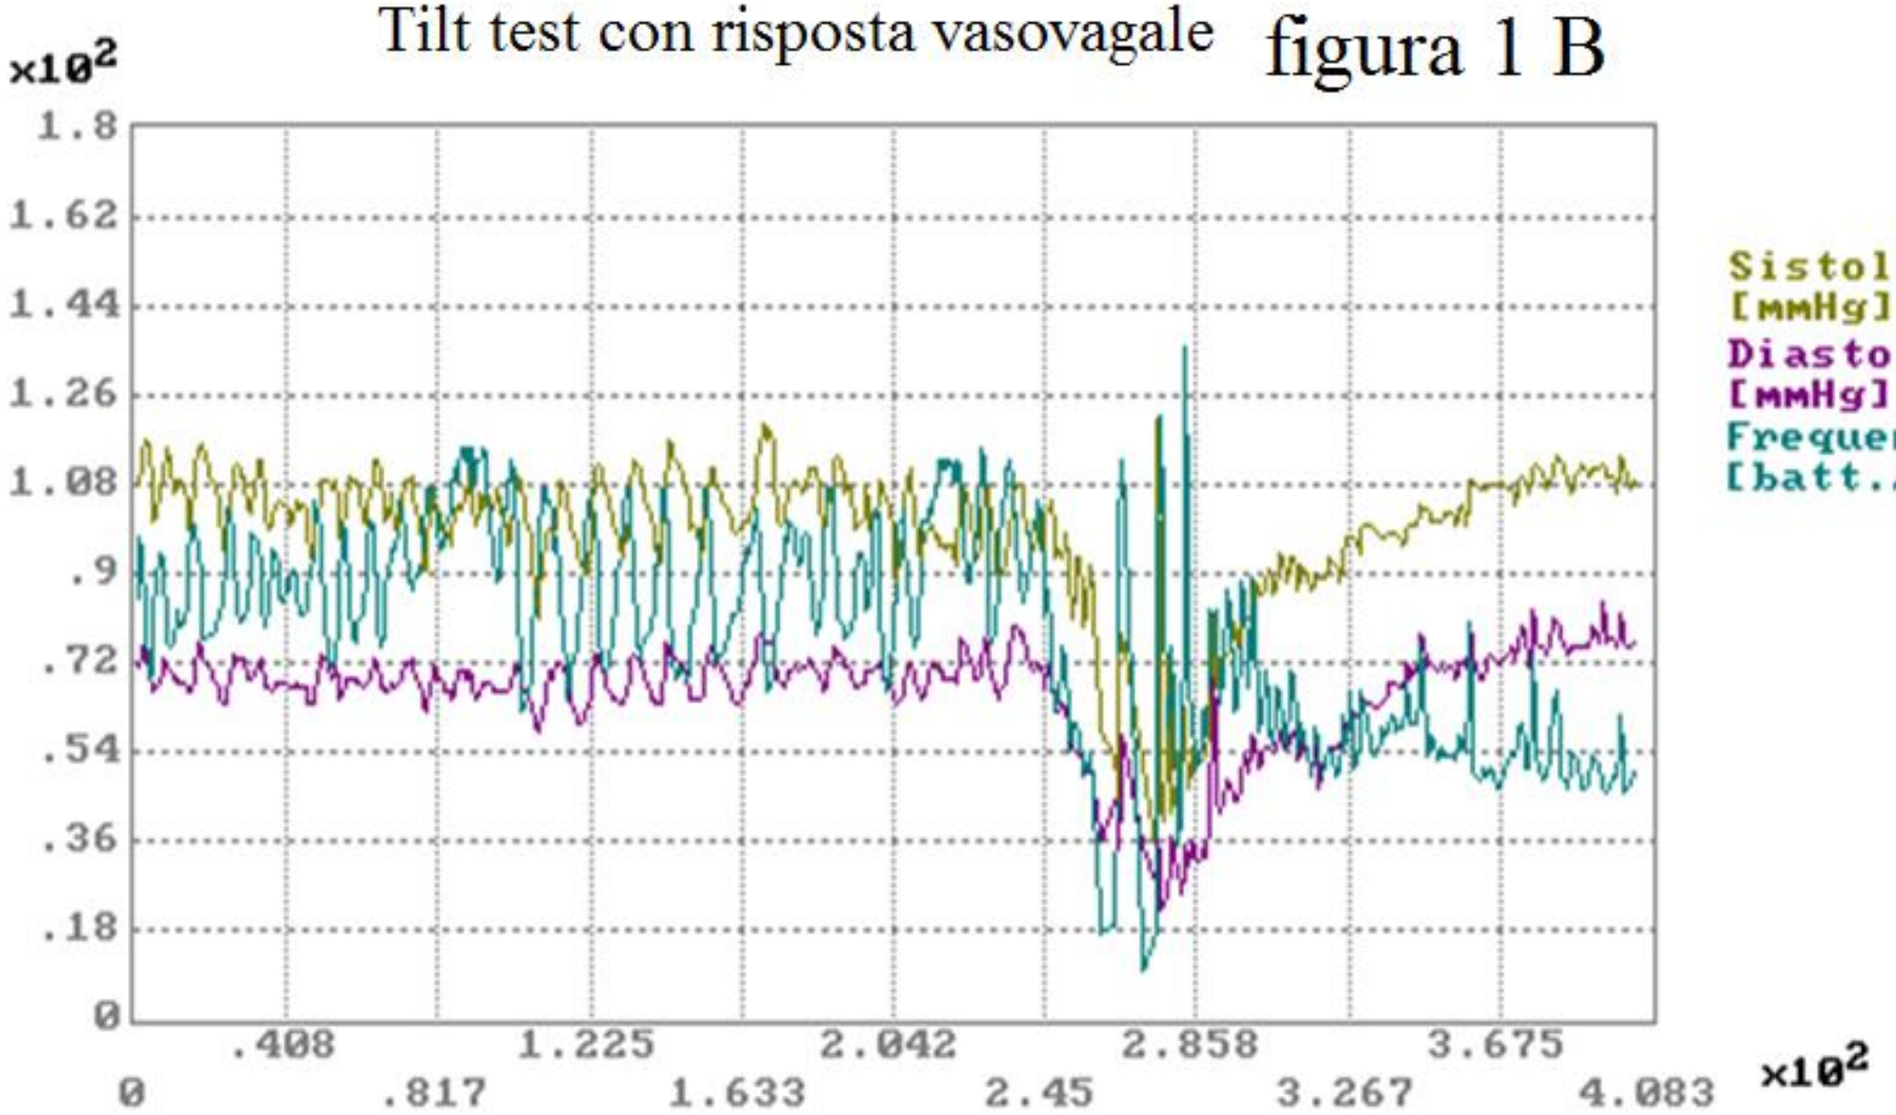
Tilt test con risposta vasovagale figura 1 B



Upright tilt → Peripheral venous pooling → ↓ Venous return → ↓ Left ventricular volume → ↓ Left ventricular contractility → ↓ Mechanoreceptor stimulation → ↓ Vasomotor center

Vasomotor center → ↓ Sympathetic tone → ↓ Peripheral vasodilatation → ↓ Hypotension → **Syncope**

Vasomotor center → ↑ Vagal tone → ↓ Bradycardia or asystole → **Syncope**

DIAGNOSTIC TEST
Tilt testing

- <u>Diagnostic criteria</u>

-In patient without structural heart disease:

- reflex syncope
- orthostatic hypotension

-LOC in absence of hypotension and or bradycardia:

- psychogenic pseudo syncope

Neurally-mediated syncope	Orthostatic hypotension syncope	Arrhitmics syncope	Cardiopulmonary syncope	Neurological syncope
• Vasovagal • Carotid sinus hypersensitivity • Situational	• Pure autonomic failure (PAF, MSA, m. Parkinson, Lewy body dementia • Secondary autonomic failure(diabetes, kidney failure,…) • Drugs	• Bradycardia syndrome (sick sinus syndrome) • Tachicardia syndrome	• Aortic stenosis • AMI • Pulmonary heart failure • Pulmonary hypertension	• Vascular thievery • TIA • Ictal bradycardia

DIAGNOSTIC TEST

Active standing

- <u>Indications</u>:

- manual intermittent determination of BP supine and during active standing for 3 min

- <u>Diagnostic criteria:</u>

- The test is diagnostic when there is a *symptomatic or asymptomatic fall* in SBP from baseline value >20 mmHg or DBP > 10 mmHg or a decrease of SBP to <90 mmHg

(Totali 888 Secondi)

Sist. R-R int / Secondi
[mmHg] [msec/10] [sec.]

SYNDROMES OF ORTHOSTATIC INTOLERANCE ABLE TO CAUSE SYNCOPE

Classific-ation	Test for diagnosis	Time from standing to symptoms	Pathophysiology	Most frequent symptoms	Most frequent associated conditions
Initial OH	Beat-to-beat SBP on lying-to-standing test (active standing).	0-30 s	Mismatch betwen CO and SVR.	Lighteadedness/dizziness, visual disturbances a few seconds after standing up, (syncope rare).	Young asthenic subjects, old age, drug induced (α-blockers), CSS.
Classical OH (classical autonomic failure)	Lying-to-standing test (active standing) or tilt table.	30 -3 min	Impaired increase in SVR in autonomic failure resulting in pooling of blood/or severe volume depletion over-riding reflex adjustments.	Dizziness, pre-syncope, fatigue, weakness, palpitations, visual and hearing disturbances (syncope rare).	Old age, drug induced (any vasoactive drugs and diuretics).
Delayed (progressive) OH	Lying-to-standing test (active standing) or tilt table.	3-30 min	Progressive fall in venous return: low CO, diminished vasoconstriction capacity (failing adaptation reflex), no reflex bradycardia.	Prolonged prodrome (dizziness, fatigue, weakness, palpitations, visual and hearing disturbances, hyperhydrosis, low back pain,	Old age, autonomic failure, drug induced (any vasoactive drugs and diuretics), co-morbidities.

Risk Categories for Drugs that Prolong QT & induce Torsades de Pointes (TdP)

Based on ongoing systematic analysis of all available evidence, CredibleMeds® places drugs into broad categories based on whether each can cause QT prolongation or TdP. Because these actions are highly dependent on the circumstances of each drug's use AND each patient's clinical characteristics, we do not attempt to rank-order the drugs within each category. Therefore, we do not recommend that these lists be used to rank-order the drugs for their relative toxicity.

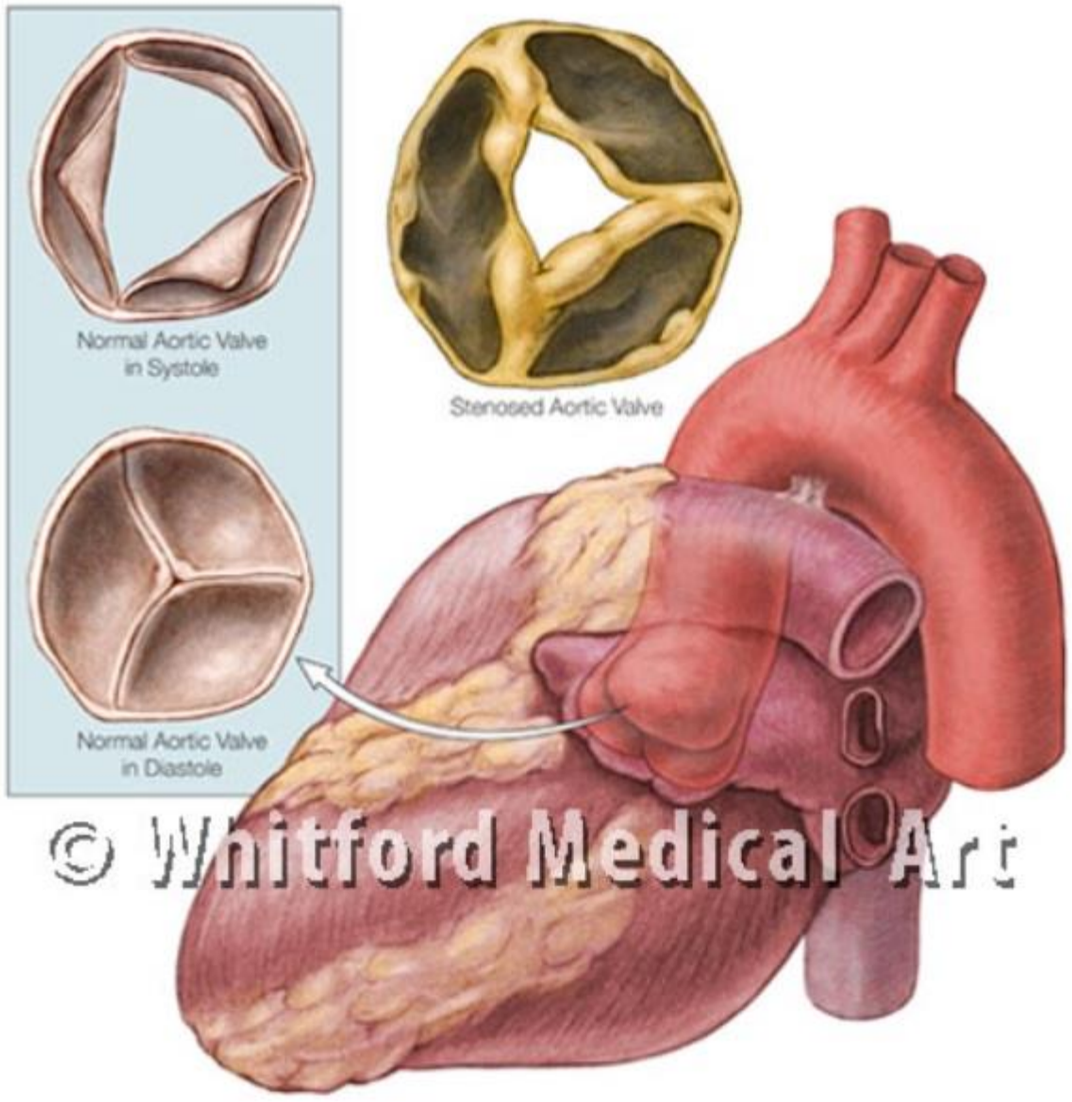
Stenotic aortic valve
Left atrium
Mitral valve
Left ventricle
P. Lynch
Senile aortic stenosis
Bicuspid aortic stenosis

Rheumatic Aortic Valve Stenosis

Aortic valve stenosis is one possible result of the postinflammatory scarring caused by rheumatic heart disease. Rheumatic aortic stenosis is characterized by commissural fusion and a thickening and distortion of the valve cusps. Because the aortic valve cannot fully open or close, the left ventricle must compensate with more forceful contractions resulting in myocardial hypertrophy. Ensuing symptoms include angina pectoris, congestive heart failure or syncope. The only treatment is surgical replacement of the damaged valve.



Heart Team:
geriatrician’s role

-Heart team: group of specialists who visit the patient,
evaluating their eligibility for the TAVR procedure

-It is composed by: cardiologist, heart surgeon, anesthetist, vascular surgeon,
geriatrician

.-The geriatrician performs a specific multidimensional assessment
(MMSE, CIRS, ADL, IADL, MNA, Rockwood, SF36 for QoL,
Chair test and Afilalo criteria).

- If the patient, independently from the performance obtained in the tests,
has a life expectancy lower than one year, or an MMSE of less than 24,
is not eligible for the procedure.

	Chromosome	Gene	Protein	Ion current affected	Trigger	Special features/ occurrence
LQTS type						
1	11p15.5	*KCNQ1*	KvLQT1 (Kv7.1)	I_{Ks}	Exercise (swimming), emotion	42–54%
2	7q35–36	*KCNH2*	HERG, (Kv11.1)	I_{Kr}	Rest, emotion, exercise (acoustic, post partum)	35–45%
3	3p24–21	*SCN5A*	Nav1.5	I_{Na}	Rest, sleep, emotion	1·7–8%; High lethality
4	4q24–27	*ANK2*	Ankyrin-B	$I_{Na\text{-}K}$, $I_{Na\text{-}Ca}$, I_{Na}	Exercise	<1%
5	21q22	*KCNE1*	MinK	I_{Ks}	Exercise, emotion	<1%
6	21q22	*KCNE2*	MiRP1	I_{Kr}	Rest, exercise	<1%
7	17q23	*KCNJ2*	Kir2.1	I_{K1}	Rest, exercise	Periodic paralysis, dysmorphic feature
8	12p13.3	*CACNA1C*	Cav1.2	I_{Ca}	Exercise, emotion	Rare, syndactyly
9	3p25.3	*CAV3*	Caveolin-3	I_{Na}	Non-exertional, sleep	Rare
10	11q23.3	*SCN4B*	NaVβ4	I_{Na}	Exercise, post partum	<0·1%
Short QT syndrome type						
1	7q35–36	*KCNH2*	HERG (Kv11.1)	I_{Kr}	Exercise, rest (acoustic)	..
2	11p15.5	*KCNQ1*	KvLQT1 (Kv7.1)	I_{Ks}	..	..
3	17q23	*KCNJ2*	Kir2.1	I_{K1}	Sleep	..
4	12p13.3	*CACNA1C*	Cav1.2	I_{Ca}	..	..
5	10p12.33	*CACNB2b*	CaVβ2b	I_{Ca}	..	..
Jervell and Lange-Nielsen syndrome type						
1	11p15.5	*KCNQ1*	KvLQT1 (Kv7.1)	I_{Ks}	Exercise (swimming), emotion	1–7%; deafness
2	21q22	*KCNE1*	MinK	I_{Ks}	Exercise (swimming), emotion	<1%; deafness

I_{Ks}=rectifier K^+ current, slow component. I_{Kr}=rectifier K^+ current, rapid component. I_{Na}=inward Na^+ current. $I_{Na\text{-}K}$=Na^+-K^+ ATPase current. $I_{Na\text{-}Ca}$=Na^+-Ca^{2+} exchanger current. I_{K1}=inward rectifier K^+ channel. I_{Ca}=Ca^{2+} current.

Table 2. Genes Involved in the Long-QT Syndrome

Variant	Gene	Protein	Effect of Mutations
LQT1	*KCNQ1*	KvLQT1	Reduced I_{Ks}
LQT2	*KCNH2*	HERG	Reduced I_{Kr}
LQT3	*SCN5A*	Nav1.5	Increased I_{Na}
LQT4	*ANK2*	Ankyrin B	Reduced membrane expression of Na^+ and Ca^{2+} channels
LQT5	*KCNE1*	MinK	Reduced I_{Ks}
LQT6	*KCNE2*	MiRP	Reduced I_{Kr}
LQT7, Andersen syndrome	*KCNJ2*	Kir2.1	Reduced outward I_{K1}
LQT8, Timothy syndrome	*CACNA1c*	Cav1.2	Increased I_{Ca}
LQT9	*CAV3*	Cardiac caveolin gene	Increased I_{Na} resulting from altered gating kinetic
LQT10	*SCN4B*	Sodium channel β_4 subunit	Reduced subunit expression causing increased I_{Na}
LQT11	*AKAP9*	Yotiao	Impaired I_{Ks} activation by catecholamines
LQT12	*SNTA1*	Syntrophin	Reduced NaV1.5 nitrosylation and increased current
LQT13	*KCNJ5*	Kir3.4/GIRK4	Reduced I_{KAch}, acetylcholine-dependent potassium current

Table 1 Risk factors for drug-induced torsades de pointes

Female gender
Hypokalaemia
Hypomagnesaemia
Bradycardia
Shortly after conversion of atrial fibrillation
Congestive heart failure
Left ventricular hypertrophy
High drug concentrations (exception: quinidine)
Unrecognized congenital long QT syndrome
Predisposing DNA polymorphisms

Paulussen AD, *J Mol Med* 2004; 82: 182-188

Farmaci che allungano il QT

Antiaritmici
IA: chinidina, procainamide, disopiramide
III: amiodarone, dofetilide, ibutilide, sotalolo
IV: bepridil, mibefranil, terodilina

Antzelevitch C, *Int J Med* 2006; 259: 70-80

Farmaci che allungano il QT

Antistaminici
Terfenadina
Astemizole
Difenilidramina

Antzelevitch C, *Int J Med* 2006; 259: 70-80

Farmaci che allungano il QT

Antimicrobici
Eritromicina, Azitromicina, Claritromicina
Trimethoprim-sulfametolaxazolo
Ciprofloxacina, Grepafloxacina, Sparfloxacina
Chetoconazolo
Pentamidina
Clorochina. Alofantrina

Antzelevitch C, *Int J Med* 2006; 259: 70-80

Farmaci che allungano il QT

Psicotropi
Aloperidolo, Droperidolo
Clorpromazina
Tioridazina
Pimozide
Risperidone, Amisulpride, Quetiapina
Sertindole
Antidepressivi triciclici e tetraciclici
Inibitori del reuptake della serotonina

Antzelevitch C, *Int J Med* 2006; 259: 70-80

Farmaci che allungano il QT

Antischemici/Vasodilatatori
Bepridil
Lidoflazine
Ketanserina
Prenilamina

Antzelevitch C, *Int J Med* 2006; 259: 70-80

Farmaci che allungano il QT

Ipolipemizzanti
Probucol
Agenti Gastrointestinali
Cisapride
Agenti Antimpotenza
Sildenafil

Antzelevitch C, *Int J Med* 2006; 259: 70-80

1. Farmaci associati a rischio di TdP	2. Farmaci potenzialmente associati a rischio di TdP	3. Farmaci da evitare in pazienti affetti o sospetti di LQTS cong.
Farmaci che sono generalmente accettati dalle autorità regolatorie come a rischio di causare TdP	*Farmaci che, in qualche segnalazione sono associati a TdP, ma per i quali mancano ancora sostanziali evidenze*	*Farmaci da evitare in pazienti con LQTS congenita diagnosticata o sospetta (anche gruppo 1, 2 e 4)*
Aloperidolo	Amantadina	Albuterolo
Amiodarone	Azitromicina	Chinidina
Arsenico triossido	Cloralio idrato	Cocaina
Chinidina	Dolasetron	Dobutamina
Clorpromazina	Felbamato	Dopamina
Claritromicina	Flecainide	Droperidolo
Disopiramide	Foscarnet	Efedrina
Domperidone	Grasinetron	Epinefrina
Droperidolo	Indapamide	Fenilefrina
Eritromicina	Isradimina	Fenilpropanolamina
Ibutilide	Levofloxacina	Midodrina
Metadone	Litio	Pseudoefedrina
Pentamidina	Moexipril-idroclorotiazide	Ritodrina
Pimozide	Moxifloxacina	Sibutramina
Procainamide	Nicardipina	Terbutalina
Sotalolo	Ocreotide	
Tioridazina	Ondasentron	
	Quetiapina	
	Risperidone	
	Salmeterolo	
	Tacrolimus	
	Tamoxifene	
	Telitromicina	
	Tizanidina	
	Venflaxina	
	Voriconazolo

Risk Categories for Drugs that Prolong QT & induce Torsades de Pointes (TdP)

Based on ongoing systematic analysis of all available evidence, CredibleMeds® places drugs into broad categories based on whether each can cause QT prolongation or TdP. Because these actions are highly dependent on the circumstances of each drug's use AND each patient's clinical characteristics, we do not attempt to rank-order the drugs within each category. Therefore, we do not recommend that these lists be used to rank-order the drugs for their relative toxicity.
